Supplementary Material

Supplementary Table S2. Summary of exploratory statistical analyses used to evaluate initial colony size, survival, final colony fate, radial extension, and logistic regression results.

Analysis	Response variable	Grouping or predictors	n	Test or model	Result	Interpretation
Initial colony size	Initial maximum diameter	Genus	37	Kruskal-Wallis test	H = 1.014; p = 0.602	No significant difference in initial diameter among genera.
Survival by genus	Alive vs non survivor at 20 months	Genus	37	Fisher-Freeman-Halton exact test	p = 0.384	No significant association between genus and final survival.
Survival by attachment substrate	Alive vs non survivor at 20 months	Attachment substrate	37	Fisher exact test	p = 0.737	No significant association between attachment substrate and final survival.
Missing/detached colonies by substrate	Missing/detached vs present at 20 months	Attachment substrate	37	Fisher exact test	p = 1.000	Missing/detached status did not differ between concrete bases and natural substrate.
Initial size and radial extension	Radial extension among surviving colonies	Initial maximum diameter	13	Spearman rank correlation	rho = -0.072; p = 0.815	No evidence that initial diameter was correlated with radial extension among surviving colonies.
Reduced logistic regression	Survival at 20 months	Genus and attachment substrate; *Porites* excluded	33	Binary logistic regression	*Platygyra* vs *Dipsastraea*: OR = 1.32, 95% CI = 0.32 to 5.53, p = 0.700; natural substrate vs concrete: OR = 0.70, 95% CI = 0.17 to 2.84, p = 0.612; likelihood ratio test p = 0.820	No significant evidence that survival differed between *Dipsastrae*a and *Platygyra* or between attachment substrates. Model was exploratory.

Note: All analyses were exploratory because the relocation was an opportunistic mitigation action, colony allocation was not randomized, and sample size was limited. *Porites* was excluded from the reduced logistic regression because no *Porites* colonies survived, producing instability in the full model due to quasi complete separation.
